WEAKER EXPRESSION ALSO DETECTED IN THE BRAIN AND ON THE SURFACE OF THE TONGUE.

-i- DEVELOPMENTAL STAGE: HIGHEST EXPRESSION WAS DETECTED IN DORSAL ROOT AND TRIGEMINAL GANGLIA BY EMBRYONIC DAY 14.5 AND CONTINUED THROUGH AT LEAST DAY 16.5.

-i- SIMILARITY: BELONGS TO THE VILLIN/GELSOLIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            STRAIN=NIH Swiss;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mature 407:81-86(2000).
Nature 407:81-86(2000).
-!- CATALYTIC ACTIVITY: ATP + L-glutamine + tRNA(Gln) = AMP +
dlphosphate + L-glutaminyl-tRNA(Gln).
-!- SUBUNIT: Monomer (By similarity).
-!- SUBCELULIAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MEDLINE=20445173; PubMed=10993077; Shigenobu S., Matanabe H., Hattori M., Sakaki Y., Ishikawa H.; "Genome sequence of the endocellular bacterial symbiont of aphids Buchnera sp. Natl. Acad. Sci. U.S.A. 99:984-989(2002).
-!- CATALYTIC ACTYUTY: ATP + L-tryptophan + tRNA(Trp) = AMP + diphosphate + L-tryptophanyl-tRNA(Trp).
-!- SUBCELLUTAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Glucose-6-phosphate 1-dehydrogenase (EC 1.1.1.49) (G6PD) (Fragment)
-!- PATHWAY: Carotenoid biosynthesis.
-!- SUBCELLULAR LOCATION: Chloroplast; chromoplast (By similarity).
-!- SIMILARITY: BELONGS TO THE LYCOPENE CYCLASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -!- CATALYTIC ACTIVITY: D-glucose 6-phosphate + NADP(+) = D-glucc
1,5-lactone 6-phosphate + NADPH.
-!- PATHWAY: Pentose phosphate pathway; first step.
-!- SIMILARITY: BELONGS TO THE GLUCOSE-6-PHOSPHATE DEHYDROGENASE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

Nat. Genet. 32:402-407(2002).

-- FUNCTION: This protein specifically catalyzes the removal of signal peptides from prolipoproteins (By similarity).

-- CATALYTIC ACTIVITY: Cleavage of N-terminal leader sequences from membrane prolipoproteins. Hydrolyses Xaa. Xbb. Xcc. | -Cys, in which Xaa is hydrophobic (preferably Leu), Xbb is often Ser or Ala, Xcc is often Gly or Ala, and the Cys is alkylated on sulfur with a diacylglyceryl group.

-- SUBCELLUIAR LOCATION: Integral membrane protein. Inner membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE=22297718; PubMed=12219091;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         from Xanthomonas oryzae pv. oryzae.";
Mol. Gen. Genet. 244:383-390(1994).
-!- FUNCTION: THIS METHYLASE RECOGNIZES THE DOUBLE-STRANDED SEQUENCE CGATCG, CAUSES SPECIFIC METHYLATION ON C-? ON BOTH STRANDS AND PROTECTS THE DNA FROM CLEAPAGE BY THE XORII ENDONUCLEASE.
-!- CATALYTIC ACTIVITY: 9-adenosyl-L-methionine + DNA cytosine = S-adenosyl-L-homocysteine + DNA 5-methylcytosine.
-!- SIMILARITY: BELONGS TO THE C5-METHYLTRANSFERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                             Gaps

Natl. Acad. Sci. U.S.A. 99:14434-14439 (2002).

-!- CATALYTIC ACTIVITY: ATP + L-glutamate + tRNA(Glu) = AMP + diphosphate + L-glutamy!-tRNA(Glu).

-!- SUBJUNIT: Monomer (By similarity).

-!- SUBCELLULAR LOCATION: Cytoplasmic.

-!- SIMILARITY: Belongs to class-I aminoacy!-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

-i - SUBUNIT: Monomer (By similarity).
-i - SUBCELLUTAR LOCATION: Cytoplasmic.
-i - SUBCELLUTAR LOCATION: Cytoplasmic.
-i - SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.

The invention relates to compounds comprising an immunogenic ligand whose sequence is based in part on residues 42-50 of human cancer articles ATF4/CREB-2. Gnot defined) and the polynucleotides encoding them. Also included are an antibody that specifically recognises and binds the compound, a method for inducing an immune response in a subject by delivering the compound, a method of immunotherapy comprising the compound, a method of immunotherapy comprising administering to a subject the antibody, an immuno effector cell that has been raised in vitro or in vivo in the presence and at the expense of an antibod presenting coll that presents the immunogenic compound in the context of an MHC (major histocompatibility complex) molecule and a method of adoptive immunotherapy comprising administering the immune especially useful in gene therapy or as compounds. The compounds are useful for reating an immune response to the synthetic and naturally occurring compounds. The compounds are useful for reating cancer, particularly coaring cancer. The compounds are useful for reating cancer, particularly coaring cancer. The compounds are useful for reating cancer, particularly coaring cancer. The compounds are also useful for generating antibodies are further useful for immunotherapy when administered to a subject. The peptides, polypeptides and polynuclectides are useful in diagnostic methods, for the detection and purification of antibodies, or as immunogenic a human cancer antigen Aff4/CREB-2 based immunogenic compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Note: Immunogenic ligands AAU74681-AAU74686 are stated to be encoded by the degenerate DNA sequences AAS20120-AAS20125 respectively but have not been cross-referenced or CDS features put in due to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention provides a number of nucleotide and protein agequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, coryneform bacterium, Coryneform bacterium, Coryneform bacterium, coryneform bacterium, patterifying a homologue of a gene derived from coryneform bacterium, coryneform bacterium, patterifying a numbor acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                             Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, cancer antigen, ATF4; CREB-2; vaccine, cytostatic,

The invention relates to compounds comprising an immunogenic ligand whose sequence is based in part on residues 42-50 of human cancer antigion ATP4/CREB-2. (not defined) and the polymucleotides encoding them. Also included are an antibody that specifically recognises and binds the compound, a method of immunotherapy comprising the compound, a method of immunotherapy comprising the compound, a method of immunotherapy comprising dealivering the compound, an immune effector cell that has been raised in vitro or in vivo in the presence and at the expense of an antisping presenting cell that presents the immunogenic compound in the context of an MHC (major histocompatibility complex) molecule and a method of adoptive immunotherapy comprising administering the immune response of context of an MHC (major histocompatibility complex) molecule and a method of adoptive immunotherapy comprising administering the immune response of the synthetic and naturally occurring compounds. The compounds are useful for medulating an immune response to the synthetic and naturally or as components of antibodies are further useful for immunotherapy when administered to a subject. The peptides, polypeptides and polyfication of antibodies, or as immunogens for the detection and purification of antibodies, or as immunogens for the production of antibodies. The invantion of the invantion of antibodies. The invantion of the invantion of antibodies are immunogenic companies. The invantion and purification of antibodies, or sequence represents a human cancer antigen ATF4/CRB-2 based immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, cancer antigen, ATF4; CRBB-2; vaccine; cytostatic; immunogenic ligand; gene therapy; MHC; major histocompatibility complex; adoptive immunotherapy; cancer; ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Note: Immunogenic ligands AAU74681-AAU74686 are stated to be encoded by the degenerate DNA sequences AAS20120-AAS20125 respective. but have not been cross-referenced or CDS features put in due to the degeneracy of the DNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        o.

The invention relates to compounds comprising an immunogenic ligand whose sequence is based in part on residues 42-50 of human cancer antigien ATP4/CREB-2 foot defined) and the polymuclectides encoding them. Also included are an antibody that specifically recognises and binds them. CC compound, a method for inducing an immune response in a subject by delivering the compound, a method of immunotherapy comprising computing computation or in vivo in the presence and at the expense of an antistering to a subject the air intrody, an immune effector cell that has been raised in vitro or in vivo in the presence and at the expense of an antistering or presenting cell that presents the immunogenic compound a method of adoptive immunotherapy comprising administering the immune response context of an MHC (major histocompatibility complex) molecule and a method of adoptive immunotherapy comprising administering the immune response cc the synthetic and naturally occurring compounds. The compounds are useful for modulating an immune response to the synthetic and naturally or as components of anti-cancer vectimes. The compounds are useful for treating cancer, particularly recognise and bind to these molecules. These antibodies are further useful for immunotherapy when administered to a castimenosens for the production and purification of antibodies, or as immunogens for the production of antibodies. The present correct in the present antigen ATF4/CREB-2 based immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Note: Immunogenic ligands AAU74681-AAU74686 are stated to be encoded by the degenerate DNA sequences AAS20120-AAS20125 respectively but have not been cross-referenced or CDS features put in due to the degeneracy of the DNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
New therapeutic compounds comprising immunogenic ligands, useful for
                      for treating ovarian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..

The present invention relates to novel human coding sequences

(ABQ99568-ABQ99608) and proteins (ABP64682-ABP65022). The sequences are

cueful in therapeutic, diagnostic and research methods. The

polynucleotides may be used in the field of molecular biology as

hybridisation probes, primers for PCR, for chromosome and gene mapping,

control of production of protein, or in generation of anti-sense

the recombinant production of protein, or in generation of anti-sense

the polynucleotides are useful in diagnostics as expressed

sequence tags (ESTs) for identifying expressed genes or for physical

mapping of the human genome. The proteins may be used as molecular weight

control of maintain and expand cell population in a totipotential or

puripotential state useful for re-engineering damaged or diseased

tissues, transplantation, manufacture of bio-pharmaceuticals or the

cused to maintain and expand cell population in a totipotential or

puripotential state useful for re-engineering damaged or diseased

tissues, transplantation, manufacture of bio-pharmaceuticals or the

cused to maintain or biological activity, e.g. haematopoietic disorders,

for preventing, treating or ameliorating disorders involving aberrant

contral/peripheral nervous system diseases, mechanical and traumatic

disorders, non-healing wounds, immune descinencies and disorders,

cuted from ESTs isolated mainly by sequencing by hybridisation, and

disorders, or cancer. The polynucleotide sequences of the invention were

assembled from ESTs isolated mainly by sequencing by hybridisation, and

cassembled from ESTs isolated mainly by sequencing by hybridisation, and

in some cases, sequences obtained from one or more public databases.

Note: The sequence data for this patent did not form part of the printed

specification, but was obtained in electronic format directly from Wipo, at ftp.wipo.int/pub/published_pot_esquences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, prostate cancer, prostate cancer antigen, detection, diagnosis, neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological, antibacterial, gene therapy, neural, immune, reproductive, renal, gastrointestinal, pulmonary, cardiovascular, proliferative disorder, wound, infectious disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human prostate cancer antigen protein sequence SEQ ID NO:973.

The prostage cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, valneary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polymucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. The present invertion userings substantially putities. The present invertion userings substantially putities.

(Teferred to as open reading frame, ORFX, where X is 1-11491 process.)

In the specification). ABN15/62 to ABN27252 encode the human ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating syndrome associated with ORFX-associated disorder. ORFX polynuclectide can be used in gene therapy. ORFX sequences can be used in the therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, consciously and the organization of cancer, hyperproliferative disorders, cirrhosis of liver, contentration, cardiovascular diseases, disorders related to organization, cardiovascular diseases, disorders related to organizations preventation, cardiovascular diseases, disorders related to organization, cardiovascular diseases, disorders, infectious disease, autoimmune disorders such as multiple sclerosis, infectious disease, autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, consequence data for disorders, incisions, ulcers, for treating osteoporosis, conception or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from consecution, but was obtained in electronic format directly from WIPO configuration, but was obtained in electronic format directly from WIPO configuration, but was obtained in electronic format directly from WIPO configuration, but was obtained in electronic format directly from WIPO configuration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Blood, group, determinant; antigen; erythrocyte; oligosaccharide; glycoconjugate; glycosphingolipid; glycoprotein; glycosyltransferase;
                                                                                                                             The histo-blood group ABH determinants are major allogeneic antigens in both erythrocytes and tissues of humans. They generally constitute peripheral parts of the oligosaccharide chains of glycoconjugates i.e.linked to lipids (glycosphingolipids) or to proteins (glycoproteins). It was proposed that the A and B phenotypes were associated with glycosyltransferases that converted the H substance associated with the O phenotype to A and B respectively, through the addition of alphal-3-N-acetylgalactosamine or alphal-3-galactosyl residues to the H antigen Fuc-alphal-2Gal-betal-R. Hence, the primary products of the histo-blood group A and B genes are the respectively glycosyltransferases. This is a firagment of the A group transferase. This is a (Updated on 25-MAR-2003 to correct PF field.)

                                                The histo-blood group ABH determinants are major allogeneic antigens in both erythrocytes and tissues of humans. They generally constitute peripheral parts of the oligosaccharide chains of glycoconjugates i.e.linked to lipids (glycosphingolipids) or to proteins (glycoproteins). It was proposed that the A and B peroteins (glycoproteins). It was proposed that the A and B phenotypes were associated with the O phenotype to A and B converted the substance associated with the O phenotype to A and B converted or alphal-3-galactosyl residues to the H antigen Fuc-alphal-2Gal-betal-R. Hence, the primary products of the histo-blood group A and B genes are the respective glycosyltransferases. This is a largement of the A group transferase. See also AARS6995-R57010. They generally constitute peripheral parts of the oligosaccharide chains of glycoconjugates i.e.linked to lipids (glycosphingolipids) or to proteins (glycosphingolipids) or to proteins (glycosphingolipids) or to proteins (glycosphingolipids) or to proteins (glycosphingolipids) or to phenotypes were associated with glycosyltransferases that converted the H substance associated with the Ophenotype to A and B respectively, through the addition of alphal-3-N-acetylgalactosamine or alphal-1-galactosyl residues to the H antigen Fuc-alphal-2Galbetal-R. Hence, the primary products of the histo-blood group A and B genes are the respective glycosyltransferases. The full (Updated on 25-MAR-2003 to correct PF field.)
